

Programming and Toolkits

CS 347

Michael Bernstein

Announcements

Quiz 3 is on Thursday

Final exam is during our class's finals slot during finals week
(Thursday 3/20 3:30pm)

Last time

Intelligence augmentation aims to place AI in context by using it to amplify our own abilities

Debates rage about the levels of autonomy to grant to AIs: from fully autonomous **agents** that act on the person's behalf, to **direct manipulation** that always leaves the user in full control

Mixed initiative interaction splits the difference by asking, acting, or doing nothing based on its confidence and utility

When users cannot predict how input controls affect outputs the interface, the results can be frustrating and terrible

Today

Threshold and ceiling

Changing problem representations

Learning programming

A Small Matter of Programming

Software engineering is a highly complex task, a microcosm of many challenges in HCI

Making software engineering more accessible could empower millions to customize applications and write programs

Programming ain't easy

Developers **struggle to recover others' implicit knowledge** by inspecting code [LaToza, Venolia and DeLine 2006; Ko, DeLine and Venolia 2007; Ko et al. 2006]

Developers rarely hold all information needed for the task, and **often must turn to the web** [Brandt et al. 2009]

- Just-in-time learning of new skills, clarifying existing skills

- Reminding themselves of details

Barriers span from conceptual (how is this even possible to code?) to pragmatic (how do I express this?) [Ko, Myers, and Aung 2004]

How do we aid
programming?

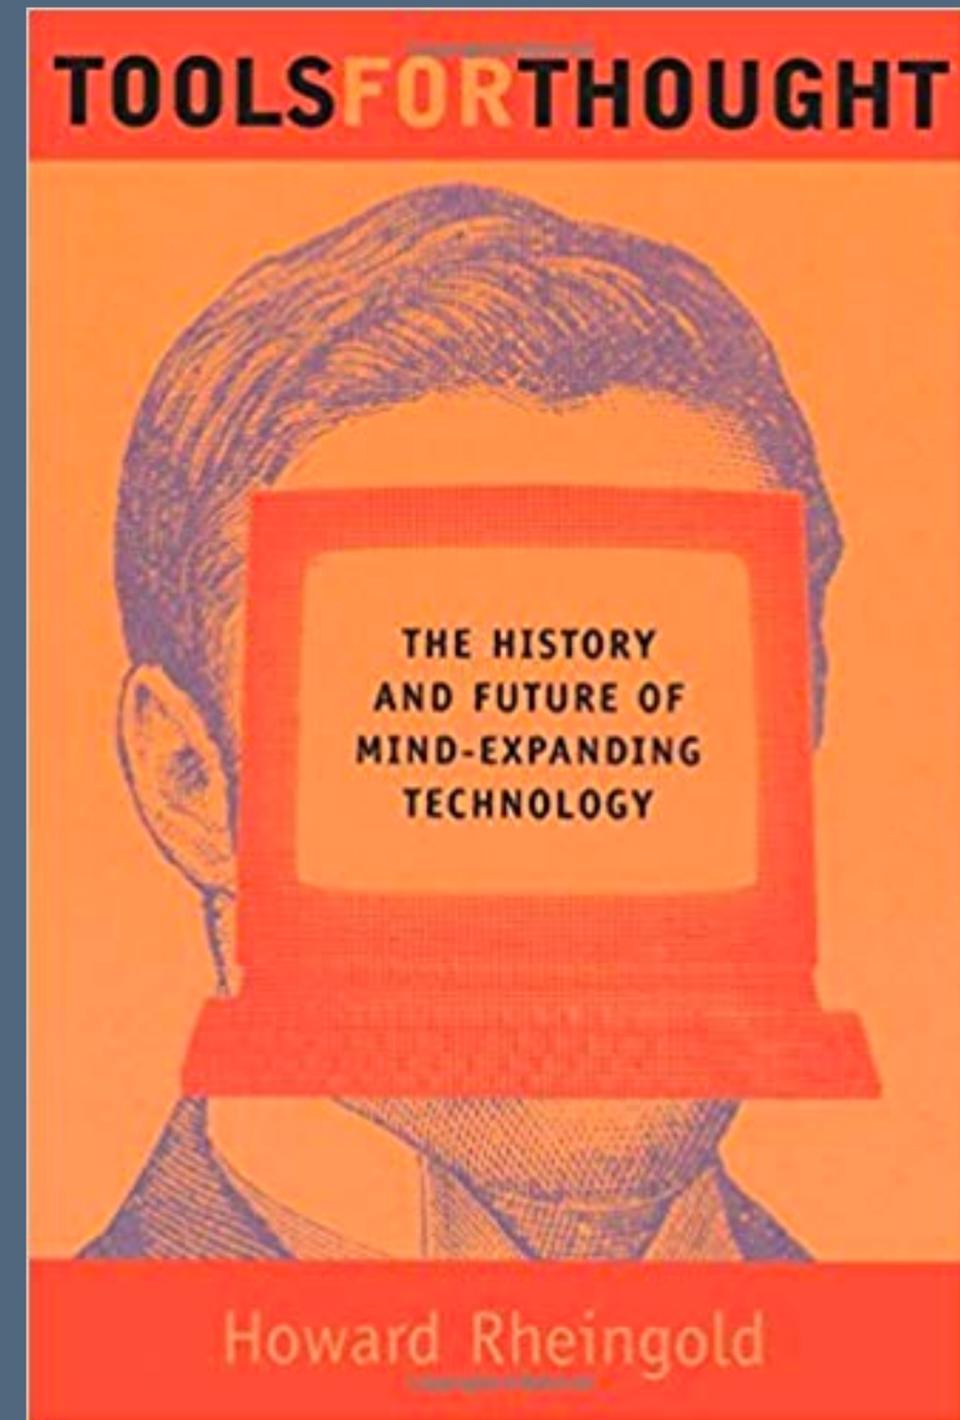

Programming as problem representation

Cognitive amplification

By better understanding human cognition, we can design technology that makes us smarter

Automation can help, but ultimately this power comes from better **representation**

“The powers of cognition come from abstraction and representation: the ability to represent perceptions, experiences, and thoughts in some medium other than that in which they have occurred, abstracted away from irrelevant details.” [Norman 1994]

Example: Number scrabble

[Simon 1969]

Take turns picking numbers in 1,2,3,4,5,6,7,8,9 without replacement

Win if any three of your numbers add up to 15. It's OK if you have extra numbers in your hand, as long as three of them add up to exactly 15.

Ready, set, go!

I will show the series of moves from players A and B so far. Raise your hand when you know what B's best next move should be.

A takes 4.

B takes 9.

A takes 2.

B takes 8.

A takes 5.

What should B do?

Re-encoding number scrabble

4	9	2
3	5	7
8	1	6

Ready, set, go!

A	B	A
	A	
B		

Domain-specific languages

DSLs, or domain-specific languages, are programming languages that are tailored to a specific domain

SQL (databases)

d3 / Vega Lite (visualization)

pytorch, keras, tensor flow (machine learning)

Successful DSLs **reshape the cognitive representation** of the task, reducing the gulfs of execution and evaluation and empowering development in their application domain

Data science representations

I have too much data to fit in my computer. How do I count the number of times the word “HCI” appears on the web?

Representation: *Map-Reduce* [Dean and Ghemawat 2008]

First, run a ***Map*** phase that runs a simple function over each webpage. That function outputs the number of HCIs, and can be run completely in parallel across every page on the web

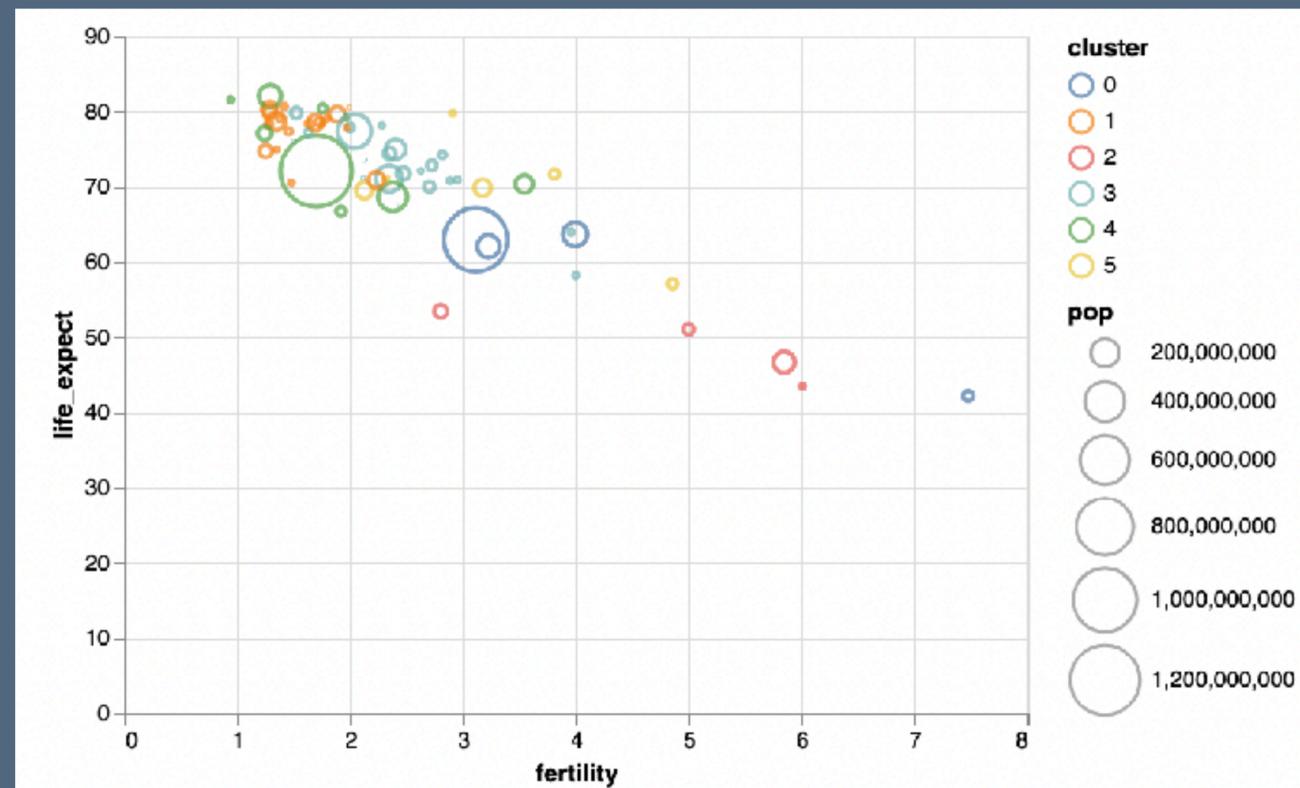

Second, run a ***Reduce*** phase that collects the outputs from the Map phase and aggregates them: here, via a sum

Representations for vis

[Bertin 1983; Mackinlay 1986; Satyanarayan 2016]

How do we tell a machine to create this? Paint pixels?

It's extremely challenging until we adopt a representation that visualizations are **encodings of data types into marks**

```
vl.markPoint()  
  .data(data2000)  
  .encode(  
    vl.x().fieldQ('fertility'),  
    vl.y().fieldQ('life_expect'),  
    vl.size().fieldQ('pop').scale({range: [0, 1000]}),  
    vl.color().fieldN('cluster')  
  )  
  .render()
```

Threshold and Ceiling

What is your programming intervention actually doing?

What is Github Copilot's design goal? How do we know if it's succeeding at that design goal?

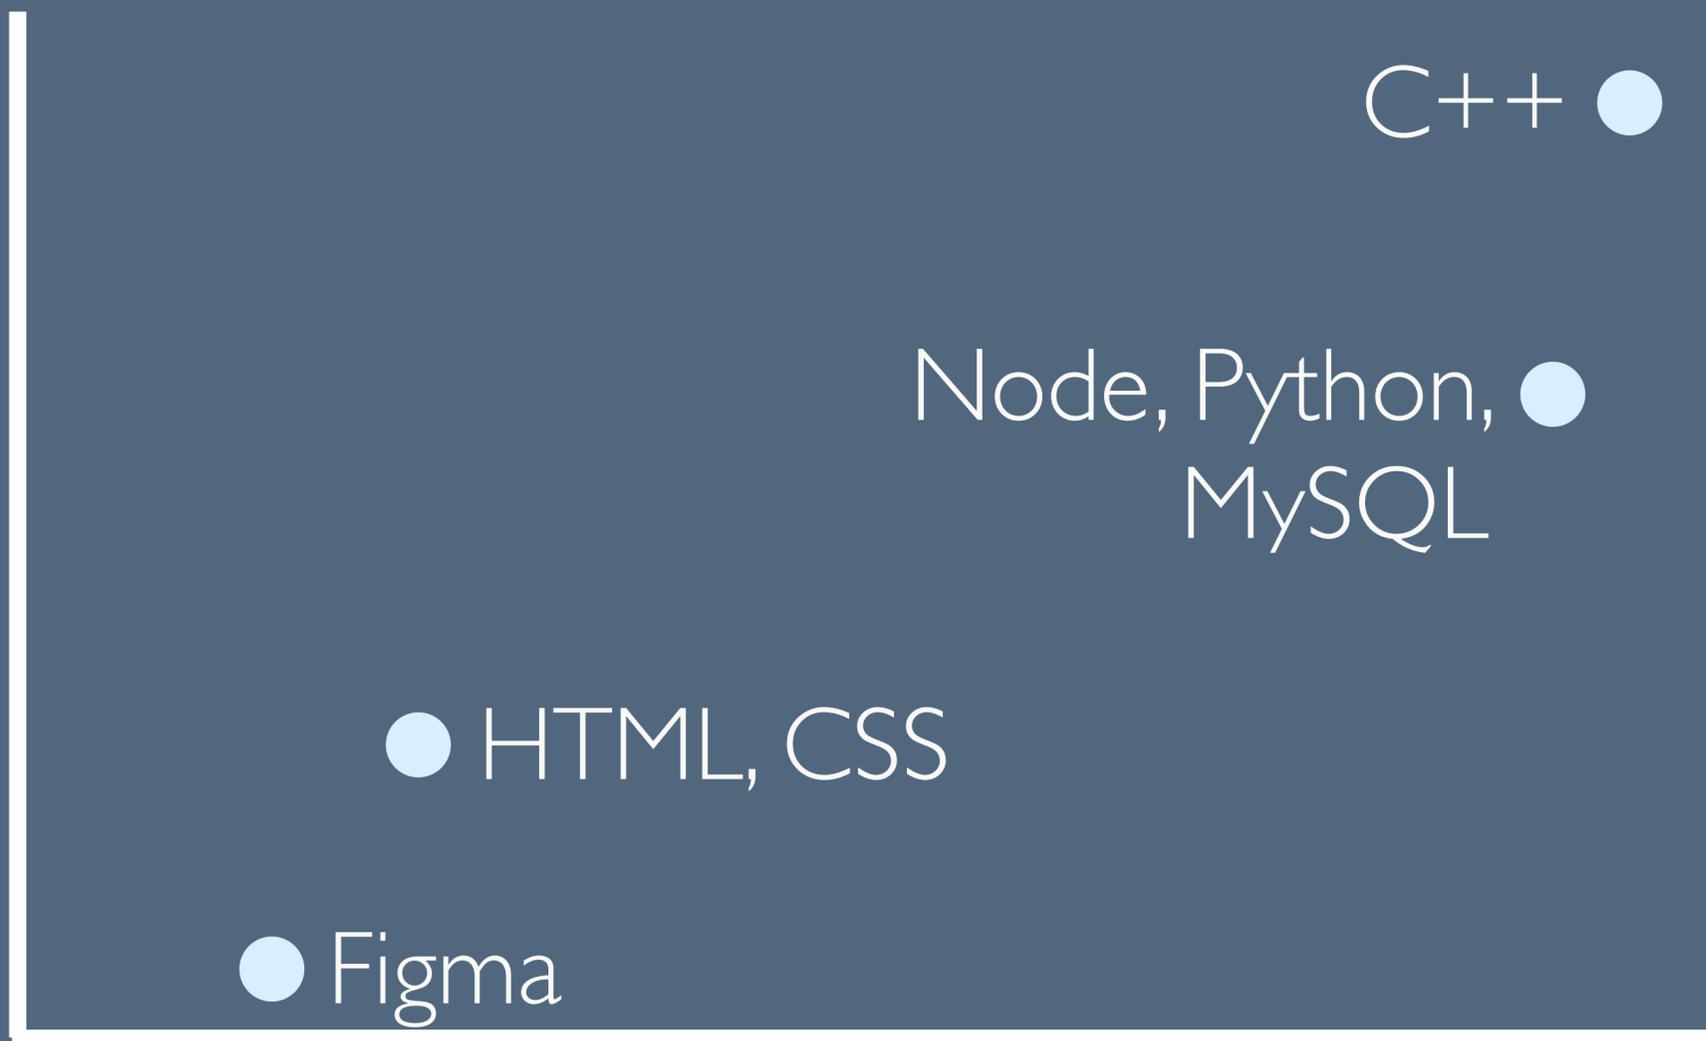

Are some programming languages "better" than others? How would we know?

Is the VSCode plugin helping? With what?

Threshold/Ceiling Diagram

[Myers, Hudson and Pausch, TOCHI 2000]

Threshold:
Difficulty of
non-expert
use

Are you trying
to **lower the
threshold**, or
**raise the
ceiling**?

Ceiling: Expressivity; sophistication of what can be created

Tradeoffs

Threshold is about **ease of use for non-experts**;

Ceiling is about **expressivity for experts**

Often, threshold and ceiling are in tension with each other.

The **command line** and **Photoshop** are **high ceiling, but also high threshold** because they require substantial up-front learning

A tool's threshold or ceiling status **may depend on the user's background**: you might be able to make striking representational art with a **simple digital brush**, even if I can only produce stuff that looks like bad graffiti

Some tools enable you to “**pop out**” to **code or advanced tools to achieve higher ceilings** for experts: e.g., Microsoft Word has a low threshold, but you can do a lot of complex layout with it if you know how

Lowering the threshold

Goal: reduce the effort and cognitive complexity of creating software artifacts

How to lower thresholds

One approach is to reduce the ceiling (expressivity) in exchange for **smaller semantic distances** in **gulf of execution or evaluation**

Regular expressions are simpler to understand than context-free grammars, but also less expressive

No-code or low-code front-end web frameworks can be fast to get off the ground but limited in what you can create

Python manages memory and garbage collection for you, but also trades off some manual optimizability of memory to achieve it

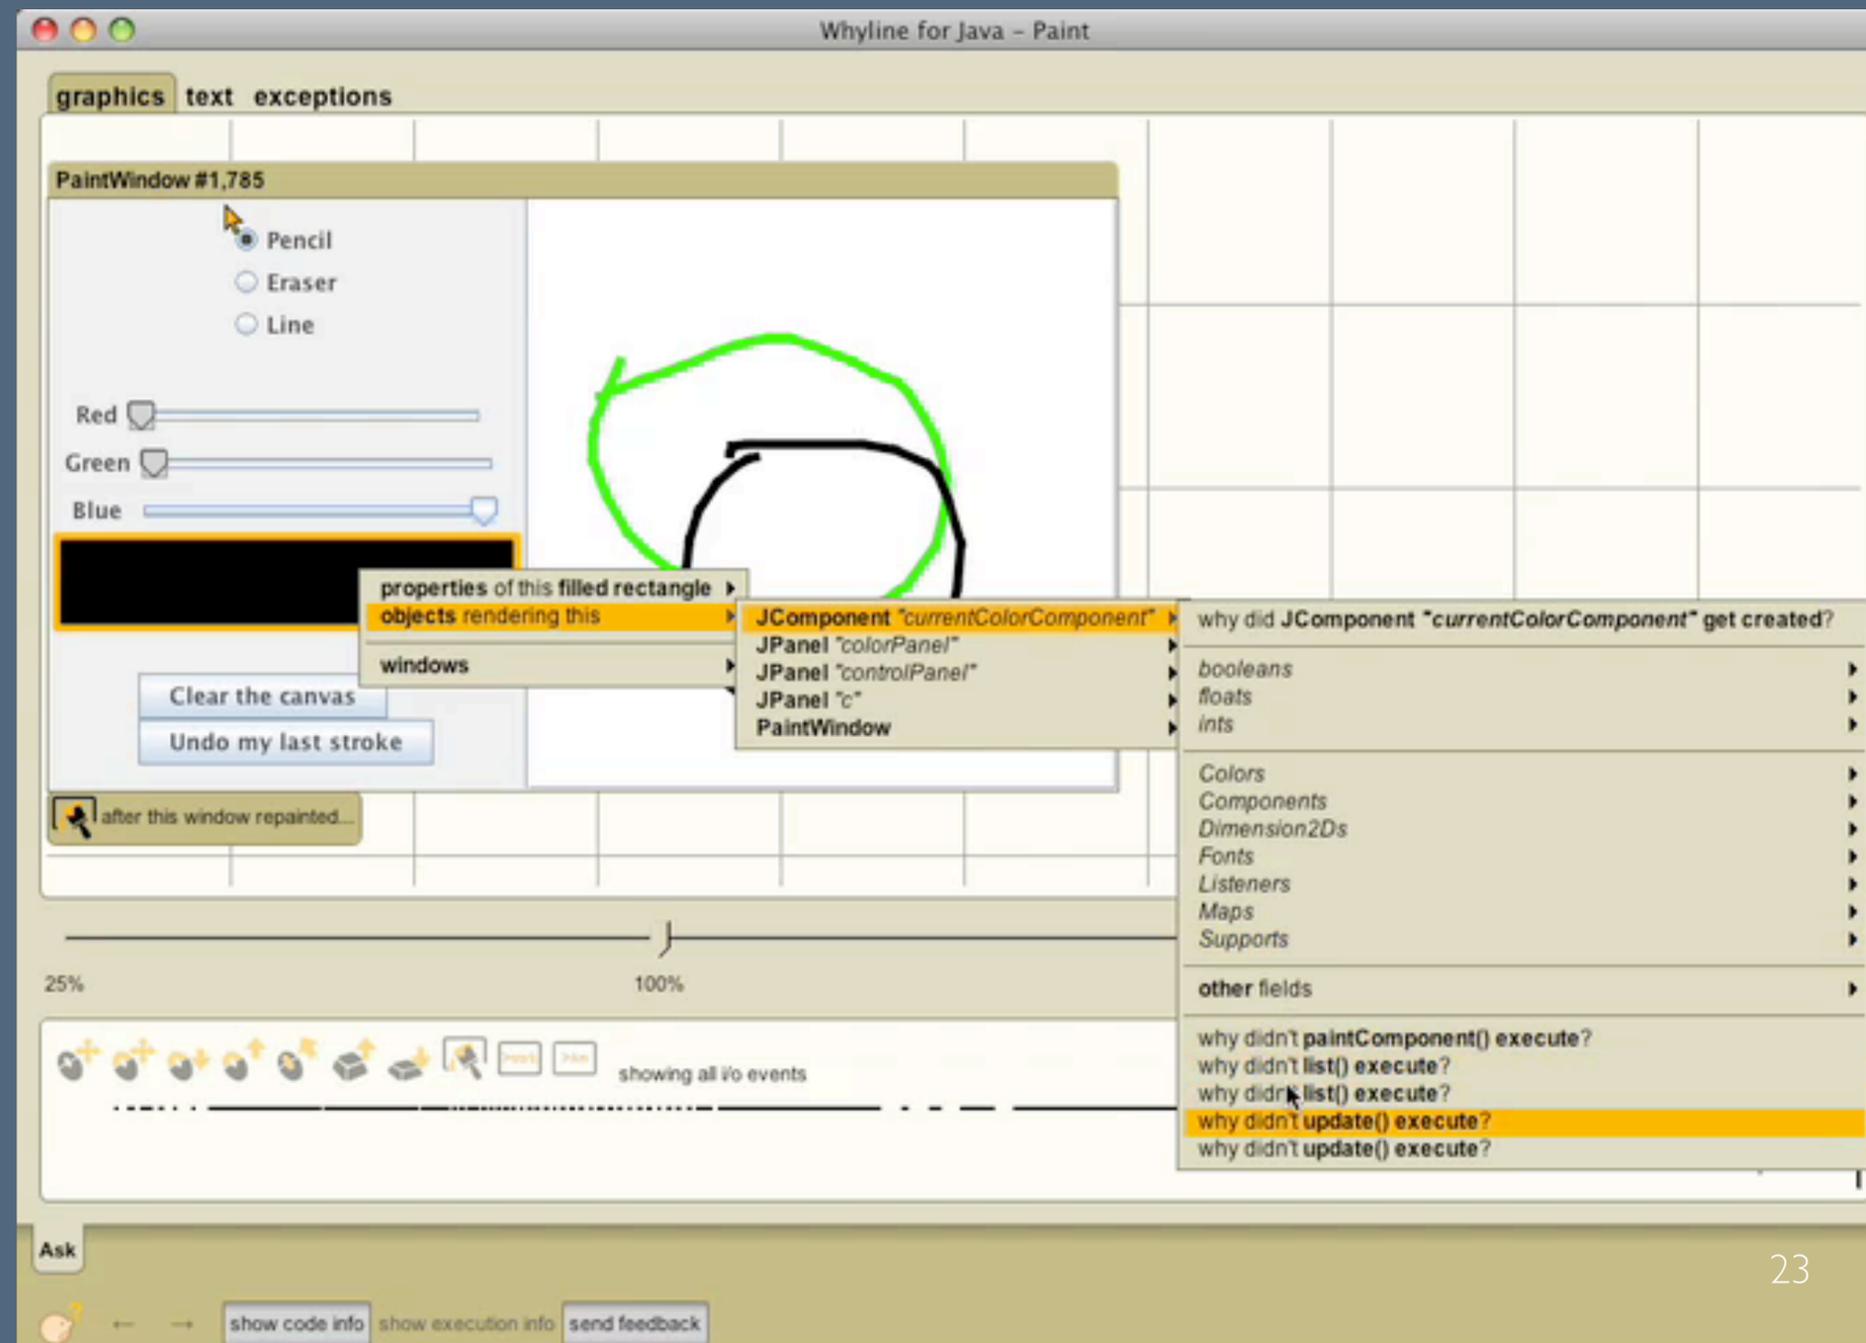

But, not all lowered thresholds require substantially lower ceilings: Python has a very high ceiling despite lowering the floor vs. C++

Asking ‘why’ questions of code

[Ko and Myers CHI '04, ICSE '09]

Debugging problems often reduce to “why” questions, but these questions are **challenging to answer** (=high threshold)

Analyze program traces to answer many unanswered “why” and “why not” questions about what just happened

Data science notebooks

Automatic cleanup of Jupyter notebooks by tracking provenance across cells [Head et al. 2019]

Importing Libraries

```
In [1]: import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
%matplotlib inline
```

Reading Data for a csv file

```
In [2]: df = pd.read_csv('input/flavors_of_cacao.csv')
```

Data Exploration

```
In [3]: df.head()
```

```
Out[3]:
```

	Company (Maker-if known)	Specific Bean Origin or Bar Name	REF	Review Date	Cocoa Percent	Company Location	Rating	Bean Type	Broad Bean Origin
0	A. Morin	Agua Grande	1876	2016	63%	France	3.75		Sao Tome
1	A. Morin	Kpime	1676	2015	70%	France	2.75		Togo
2	A. Morin	Alsane	1676	2015	70%	France	3.00		Togo
3	A. Morin	Akata	1680	2015	70%	France	3.50		Togo
4	A. Morin	Quilla	1704	2015	70%	France	3.50		Peru

Data Metrics

```
In [4]: df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 1795 entries, 0 to 1794
Data columns (total 9 columns):
Company
(Maker-if known)      1795 non-null object
Specific Bean Origin
or Bar Name          1795 non-null object
REF                  1795 non-null int64
Review
Date                 1795 non-null int64
Cocoa
Percent             1795 non-null object
Company
Location            1795 non-null object
```

Tools for statistical analysis

[Jun et al. 2019]

Non-experts often struggle to **select appropriate statistical tests**

So, instead of asking people to directly run statistical tests, instead ask them to write down the **properties of their method and data**

This representation **lowers the threshold to statistical test selection**, but **limits the ceiling** of some complex models

```
import tea
tea.data('UScrime.csv')

variables = [
    {
        'name' : 'So',
        'data type' : 'nominal',
        'categories' : ['0', '1']
    },
    {
        'name' : 'Prpb',
        'data type' : 'ratio',
        'range' : [0,1]
    }
]
tea.define_variables(variables)

study_design = {
    'study type': 'observational study',
    'contributor variables': 'So',
    'outcome variables': 'Prpb',
}
tea.define_study_design(study_design)

assumptions = {
    'groups normally distributed': [['So', 'Prpb']],
    'Type I (False Positive) Error Rate': 0.05
}
tea.assume(assumptions)

hypothesis = 'So:1 > 0'
tea.hypothesize(['So', 'Prpb'], hypothesis)
```

Programming by demonstration (PBD)

Programming by demonstration (PBD): teach a computer a program by doing it yourself while it watches

Challenges

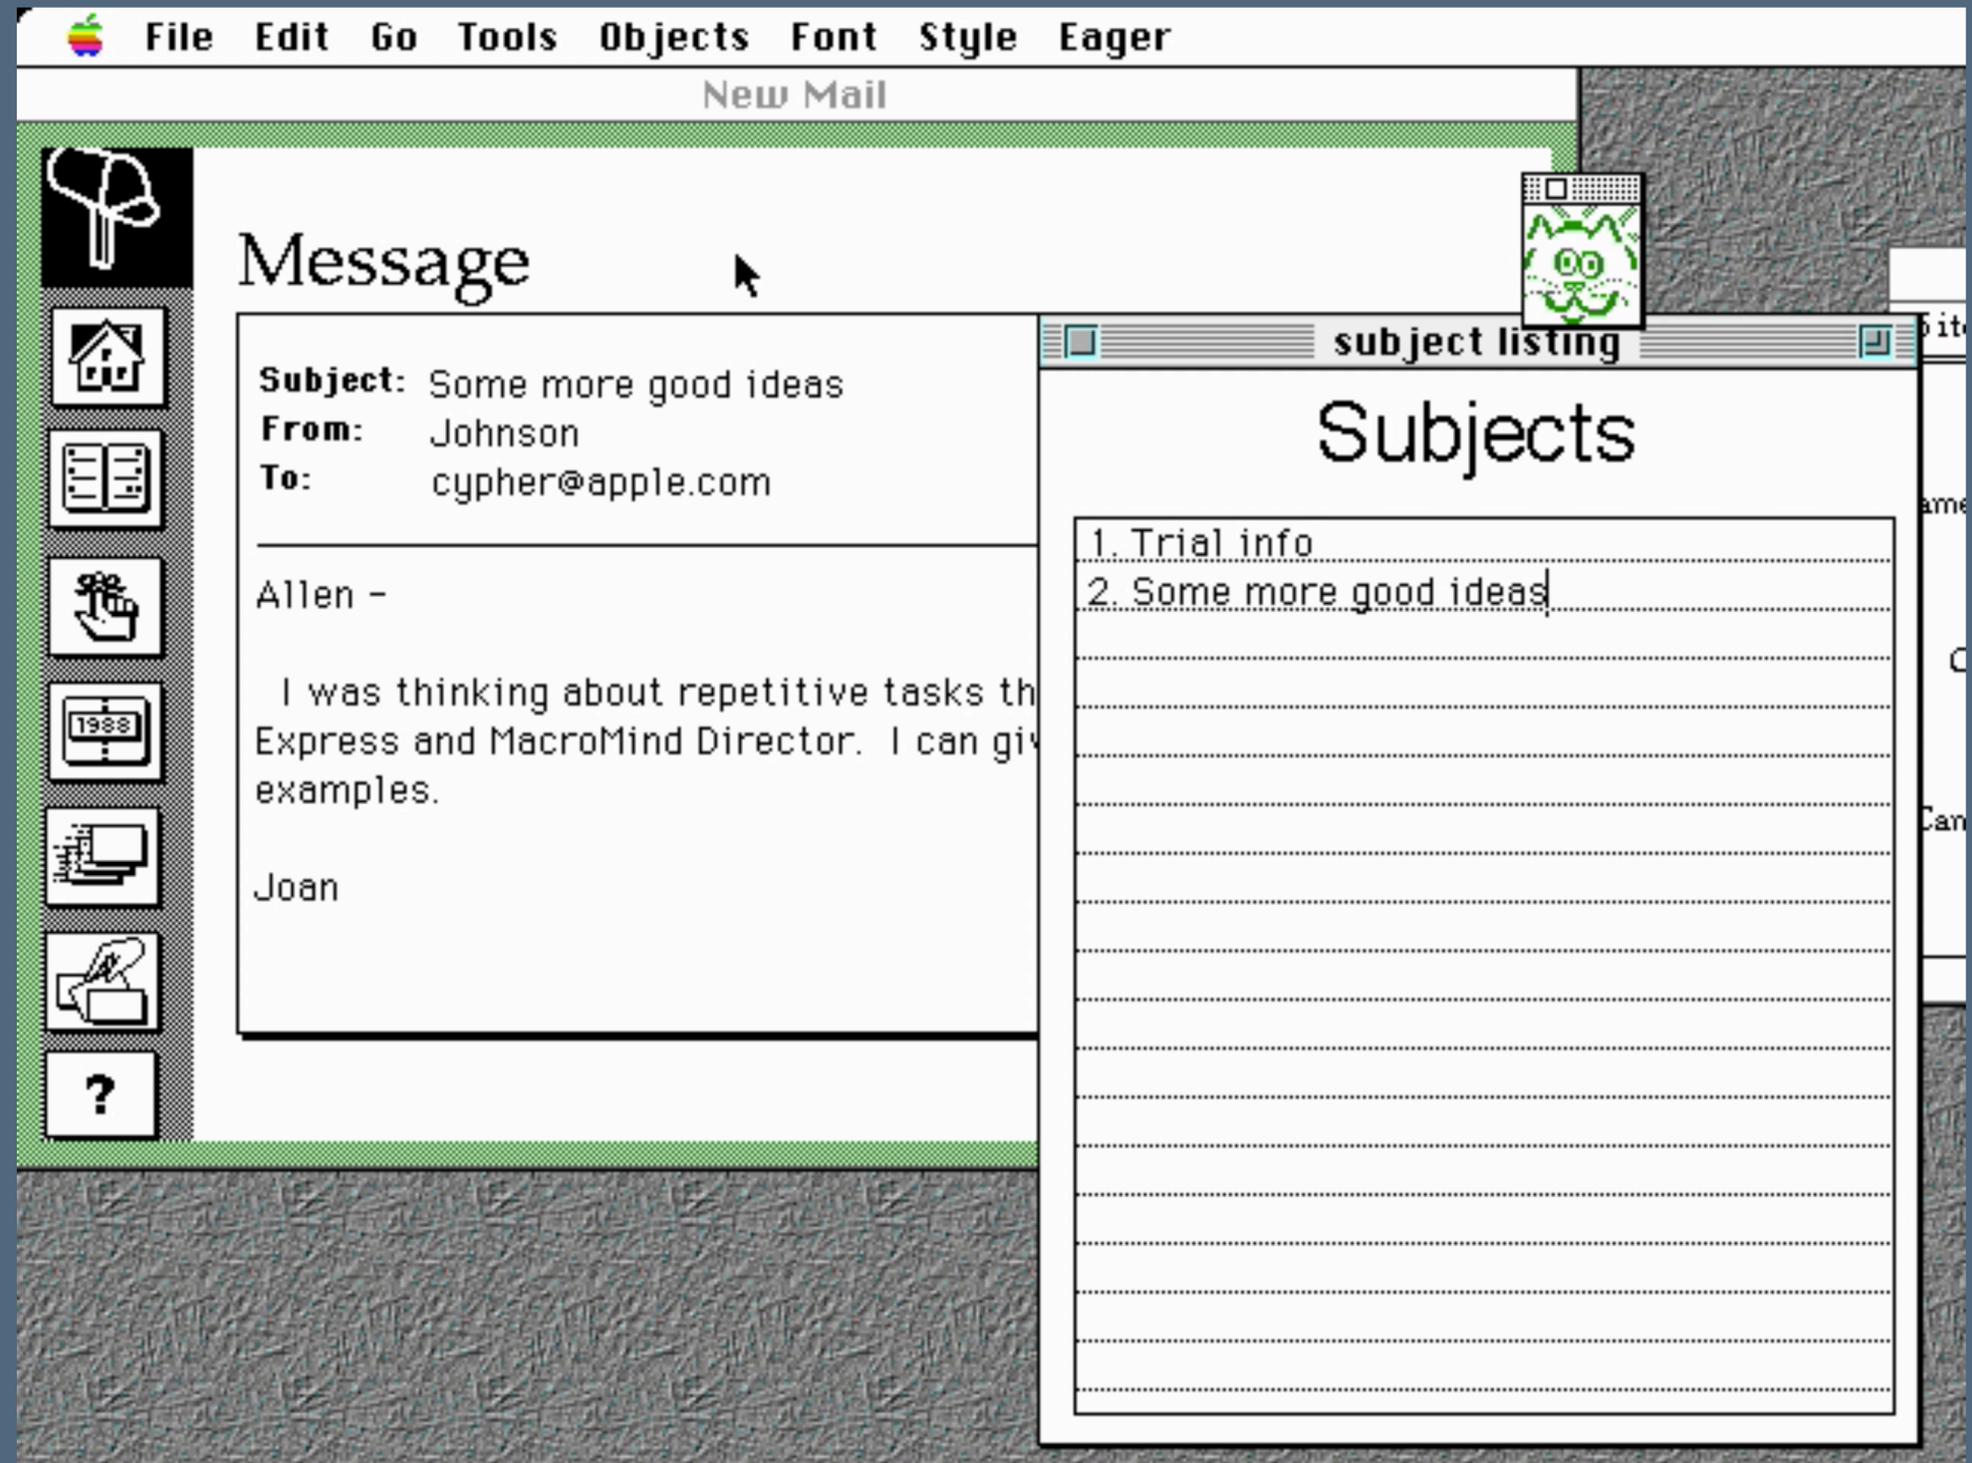

There is an infinite, and hugely branching, space of programs that might be inferred

Inferred macros can be extremely brittle

PBD on the desktop

[Cypher 1991]

Infer a macro by
watching the user's
behavior

Modern PBD: Excel flash fill

[Gulwani 2011]

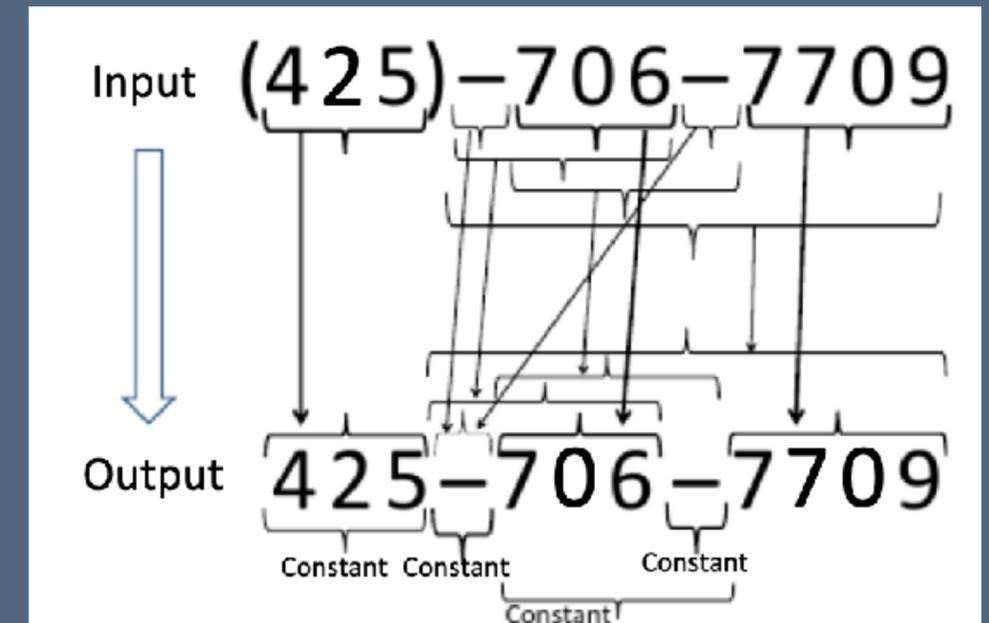

Modern PBD: Excel flash fill

[Gulwani 2011]

Develop a domain-specific language of string transformations, and learn from examples how to decompose it into subproblems

Machine learning ranks between all possible valid programs

Raising the ceiling

Goal: increase expressivity—range and (sometimes) complexity of what can be created

How to increase the ceiling

Identify opportunities for **untapped expressivity** in the current language, and position the software to expose that level of expressivity

This is not about “adding knobs”: it’s about (metaphorically) providing new paint colors in the palette

Non-programming examples

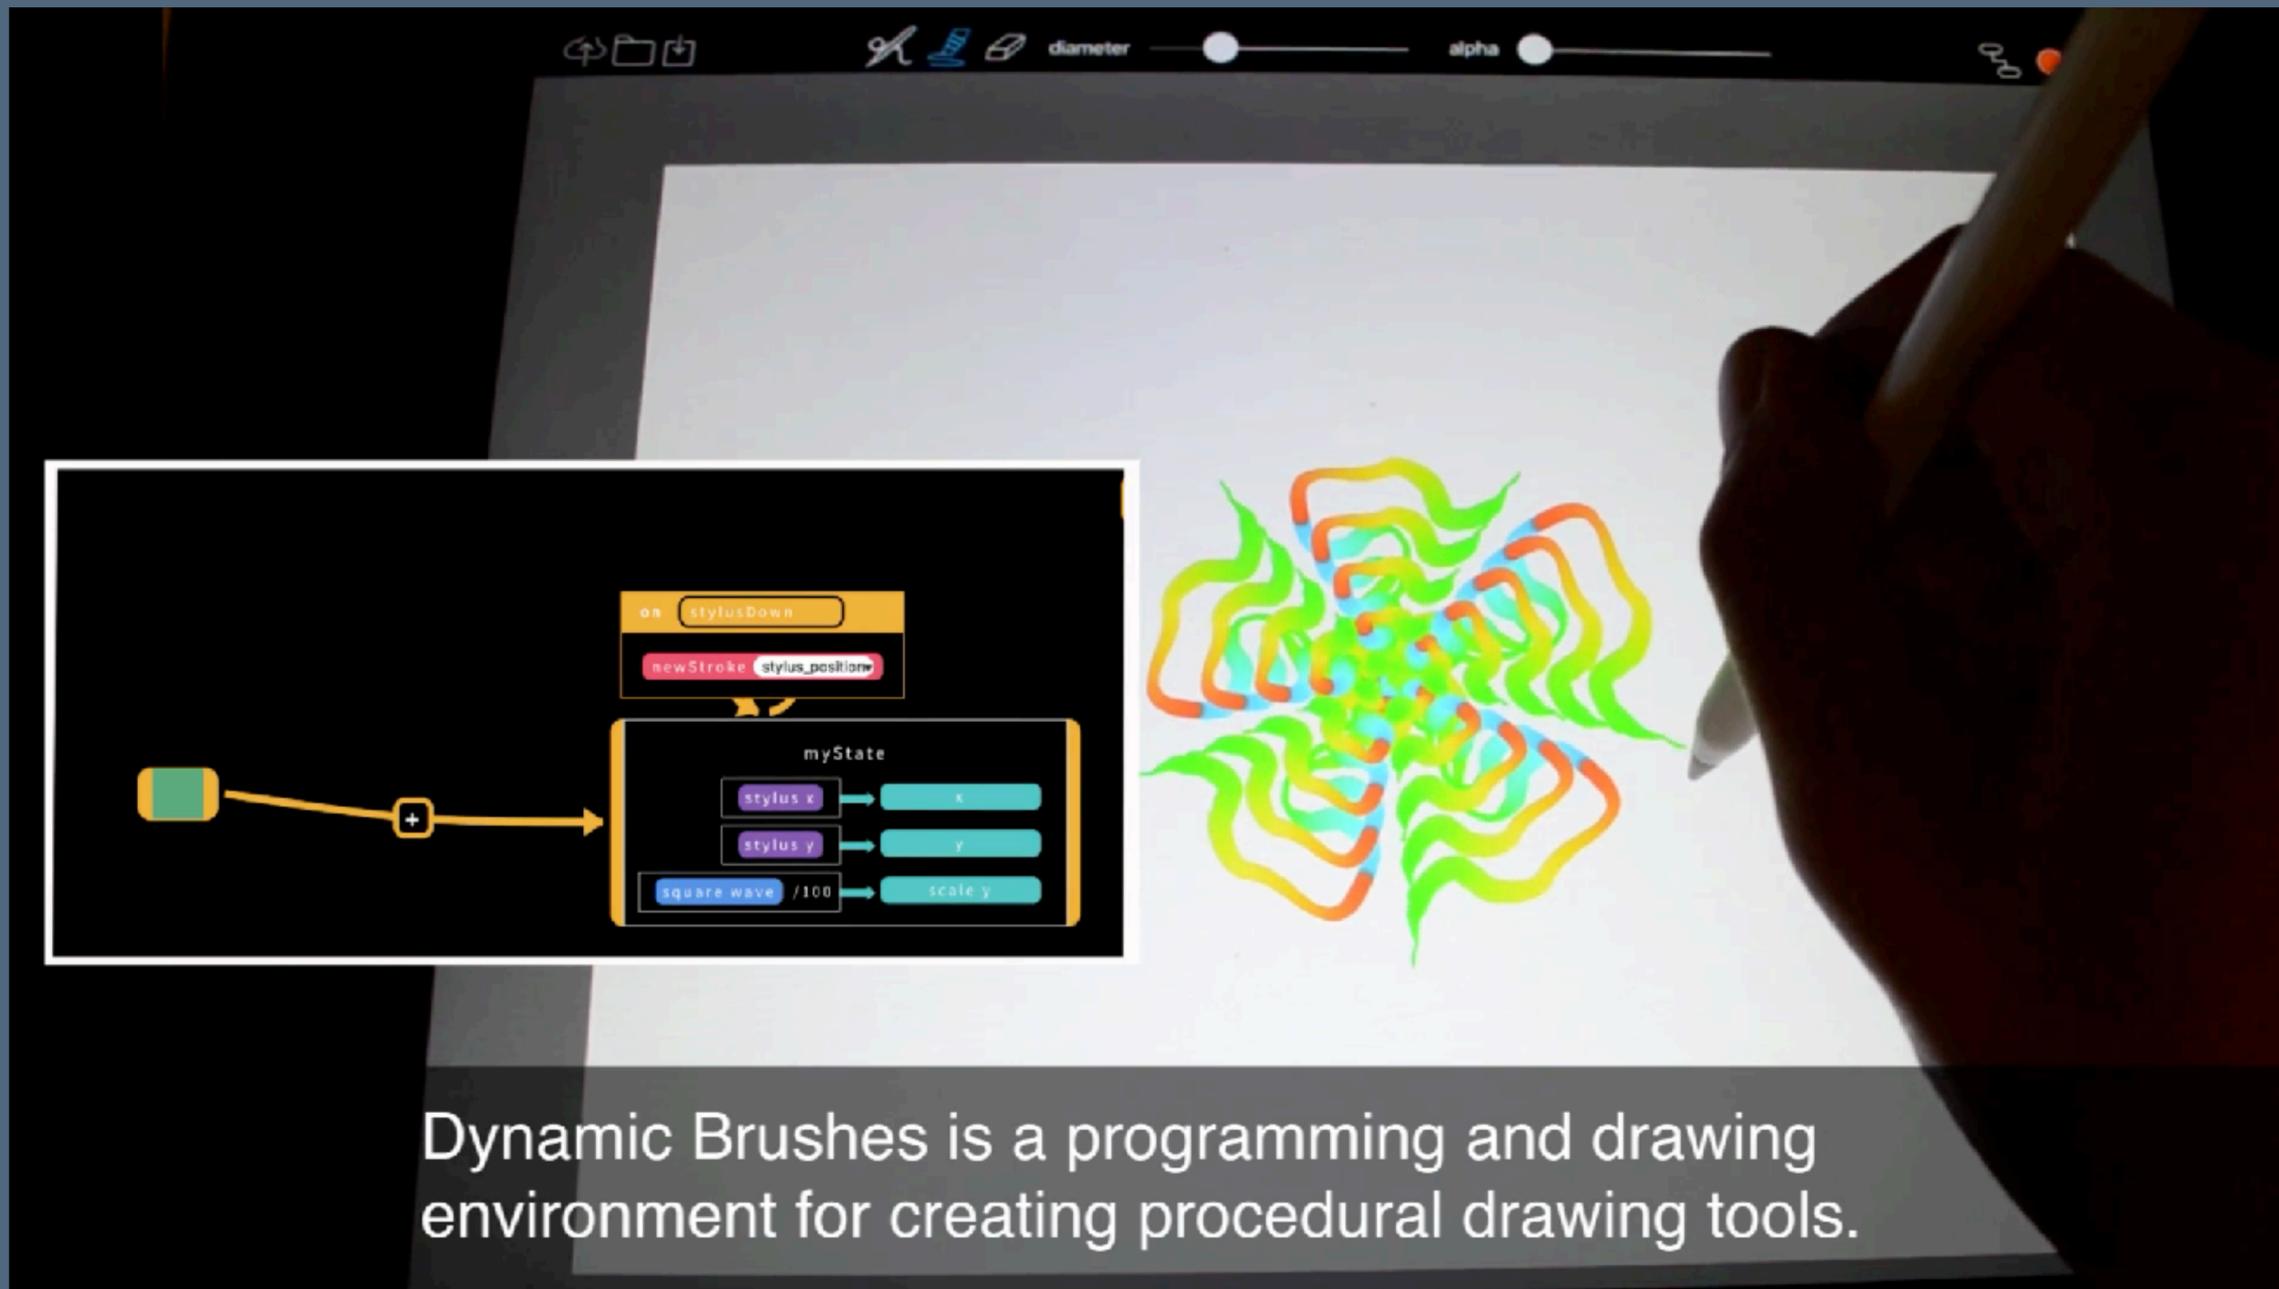

Engelbart's chorded keyset
[Engelbart 1968]

Musical instruments: the goal isn't to reduce the threshold to playing the piano — it's to enable high musical expressivity

Programmable artist brushes

[Jacobs et al. 2018]

Attaching computational functions to brushes enables new forms of artistic expression

Dynamic Brushes is a programming and drawing environment for creating procedural drawing tools.

Alternative representations for AI under disagreement

[Gordon et al. 2022]

Algorithmic decision as a jury decision. Specify a jury of, say, 12 members, and articulate what proportion of the jury should represent each group and intersectional identity

“For this jury of 50% men and 50% women, which is split evenly between White, Hispanic, AAPI, Black, and Native American jurors, 56% agree the comment is toxic.”

Jury learning

“1. People still eat at Pizza Hut? Gross. 2. It is shameful how this country [...]”

Input

7 to 5: toxic

Compose a jury by selecting from characteristics in the dataset

Your jury composition

Total: 8

A₁ A₂ A₃ A₄ A₅ B₁ B₂ B₃

Juror Selection

+ Add a juror sheet

Juror Sheet A

+ Add characteristic

Seats

Your input example

System selects matching annotators from the dataset as jurors

ANNOTATOR POPULATION
FROM DATASET

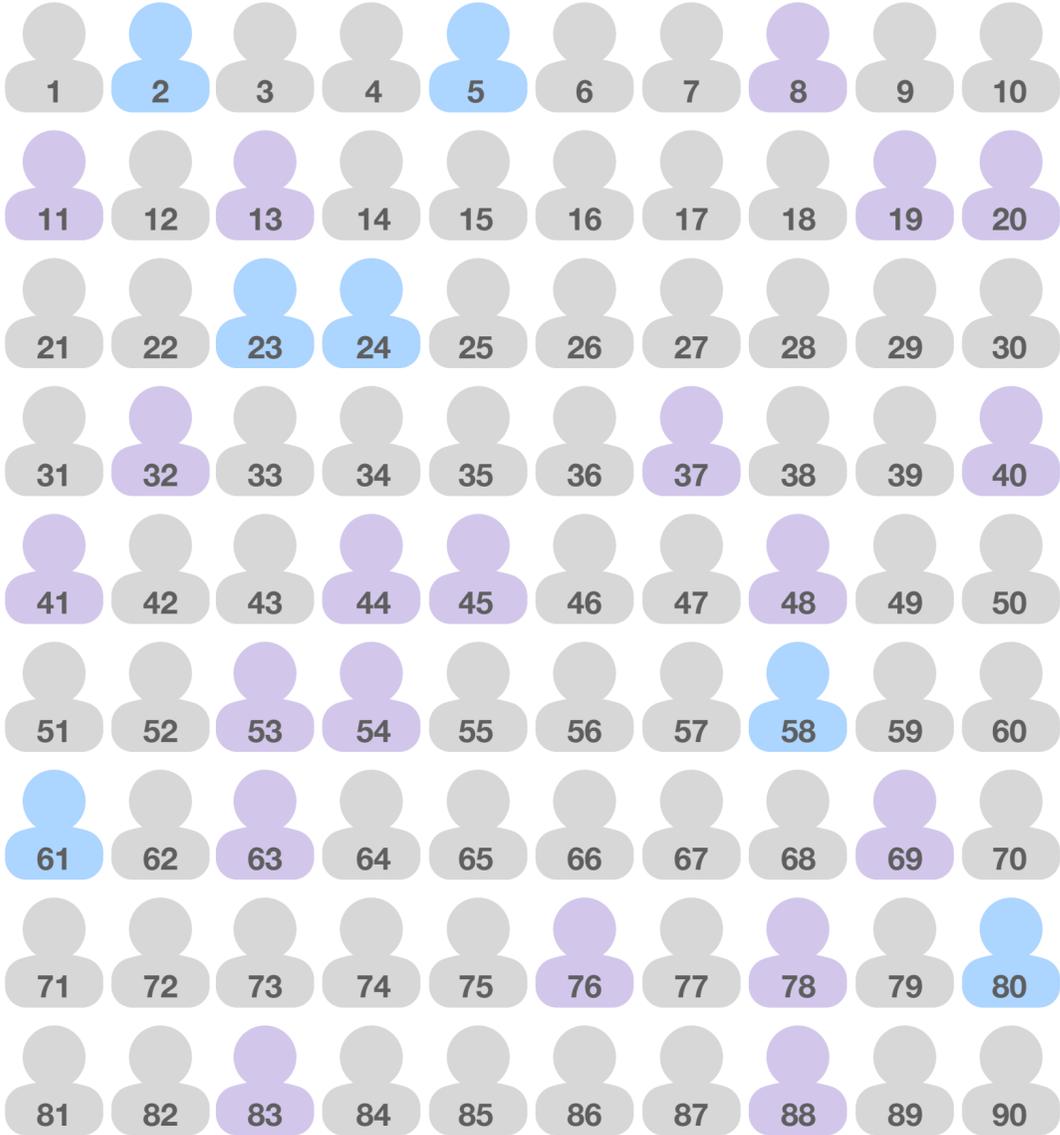

JURY

System selects matching annotators from the dataset as jurors

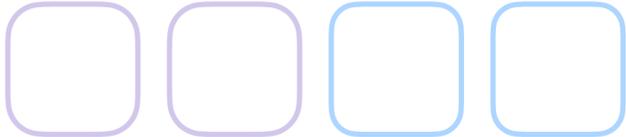

ANNOTATOR POPULATION FROM DATASET

A: Liberal

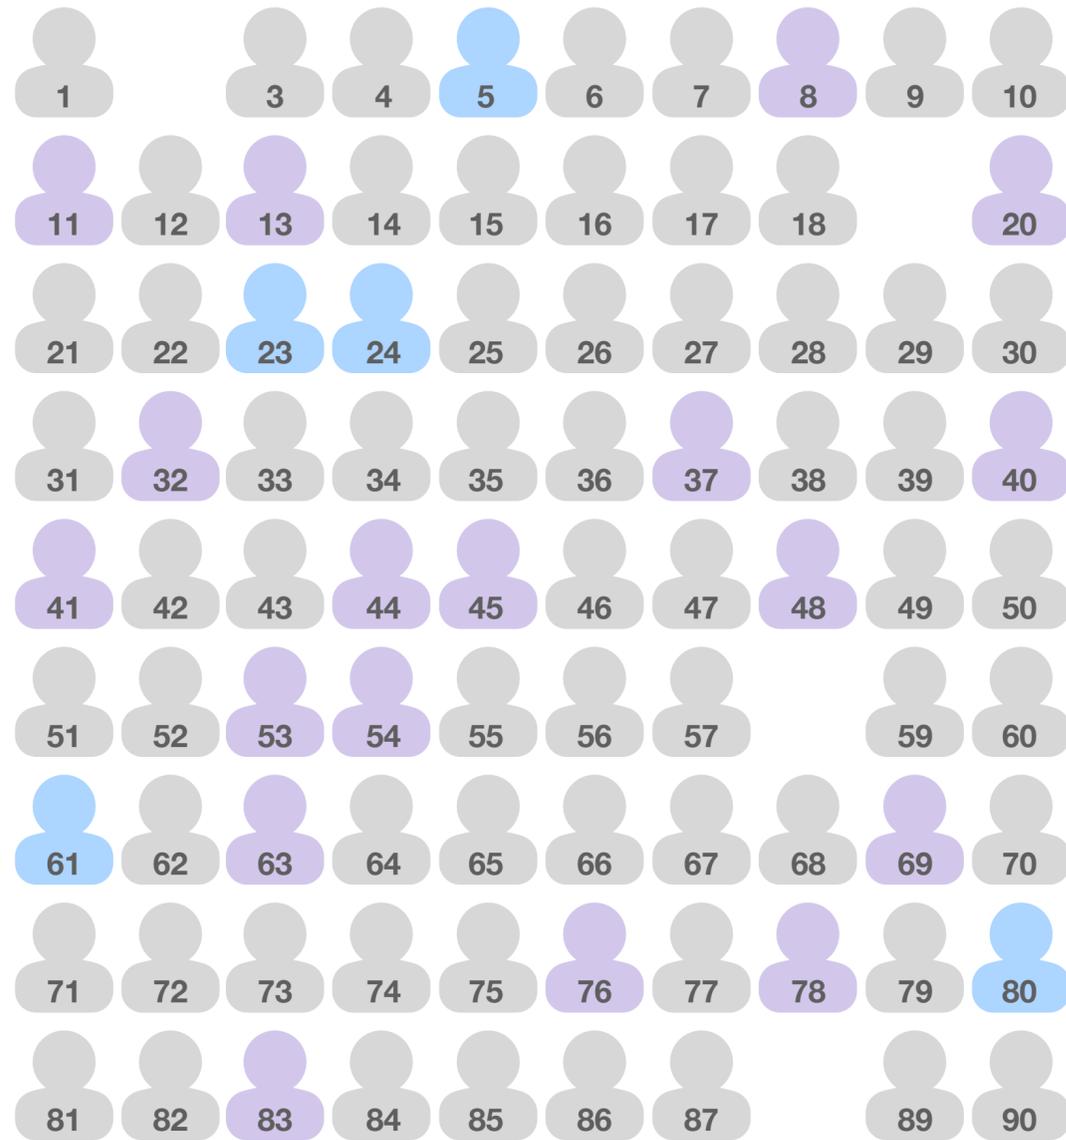

B: Parents + HS Diploma

JURY

System selects matching annotators from the dataset as jurors

ANNOTATOR POPULATION FROM DATASET

A: Liberal

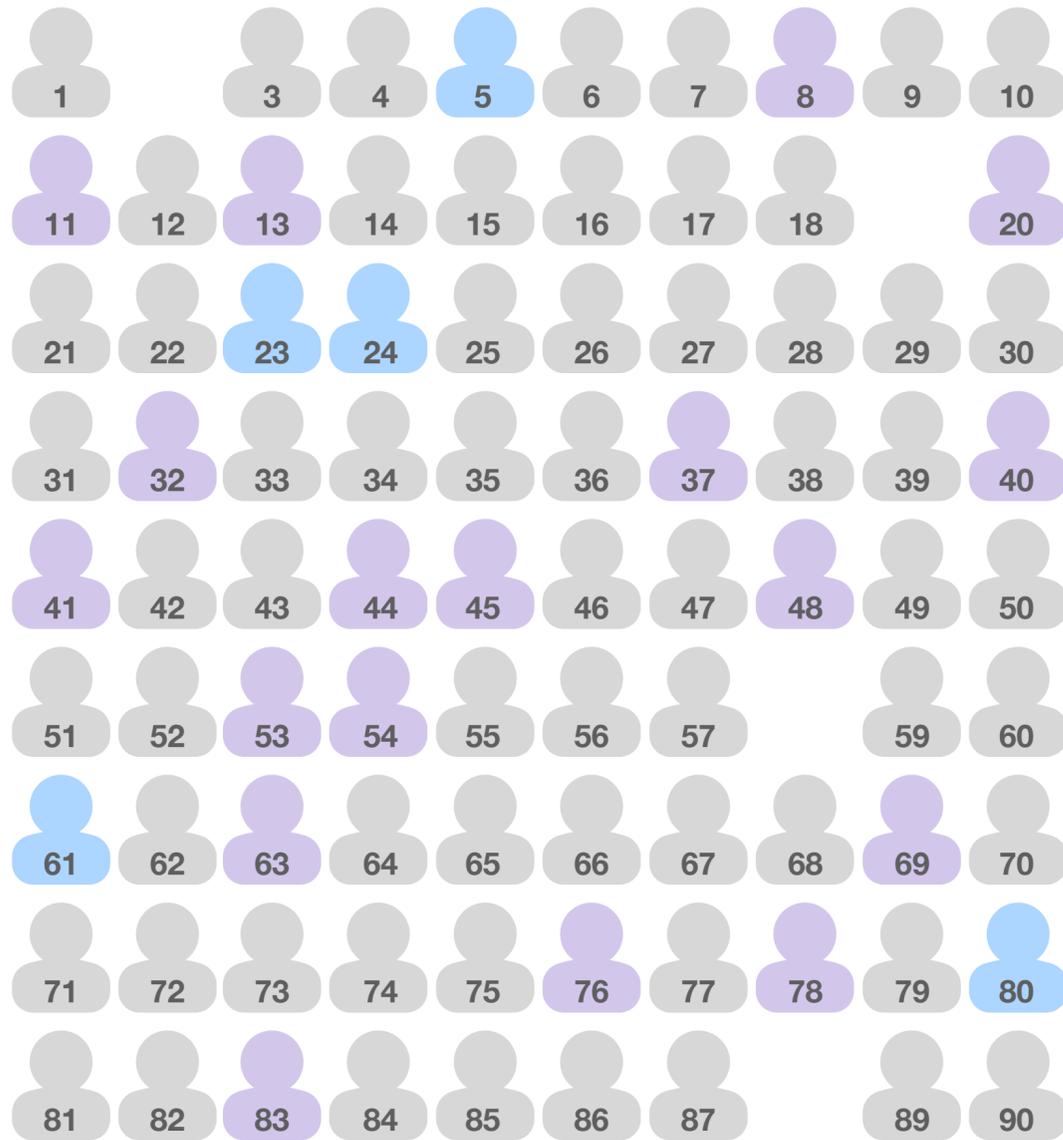

B: Parents + HS Diploma

JURY

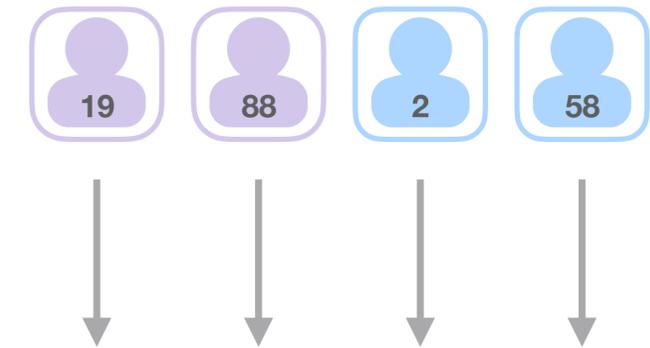

AI predicts how each juror would vote

ANNOTATOR POPULATION FROM DATASET

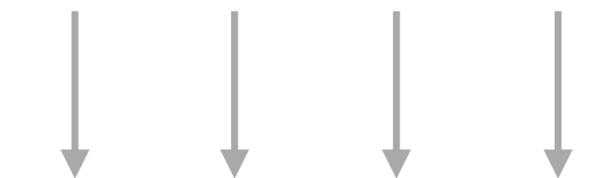

- A: Liberal
- B: Parents + HS Diploma

JURY

AI predicts each juror's response

not toxic not toxic toxic not toxic

3 to 1: not toxic

Why does Jury Learning raise the ceiling?

One could argue that jury learning lowers the threshold, since it **refocuses attention from technical desiderata into “who should be on the jury?”**

But, at least as importantly, it **raises the ceiling by increasing the expressivity of the AI models you can construct** for tasks where there is nontrivial disagreement

(This expressivity is why jury learning outperforms SOTA on the task.)

Learning programming

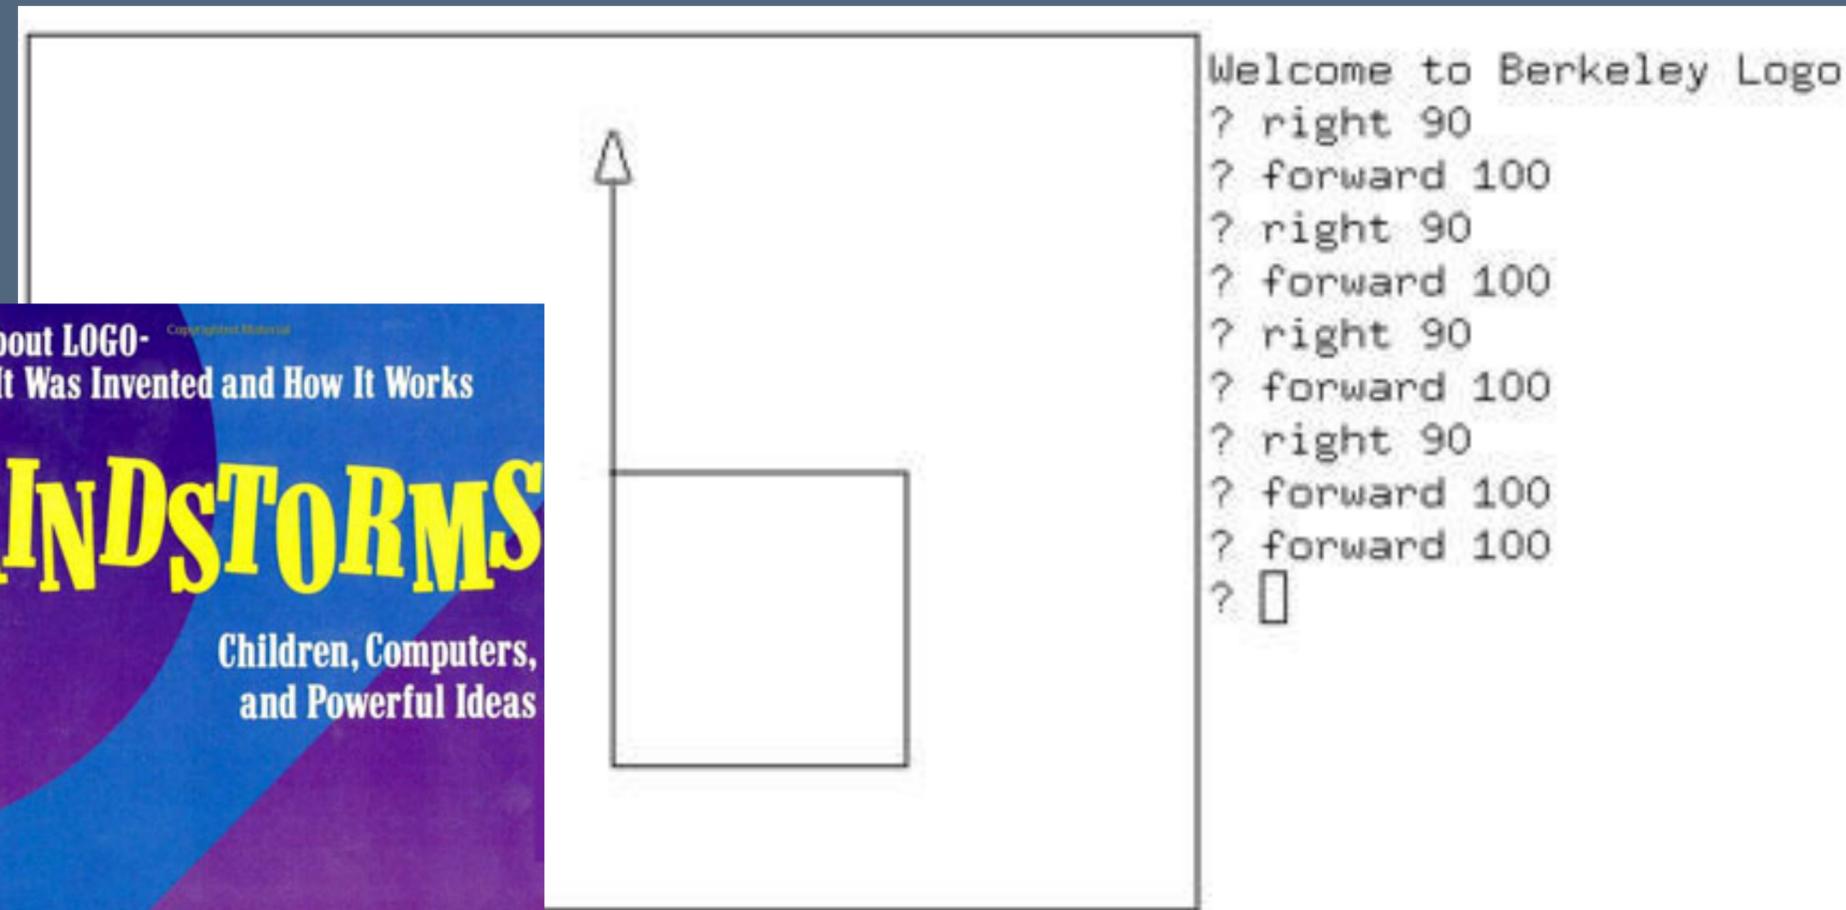

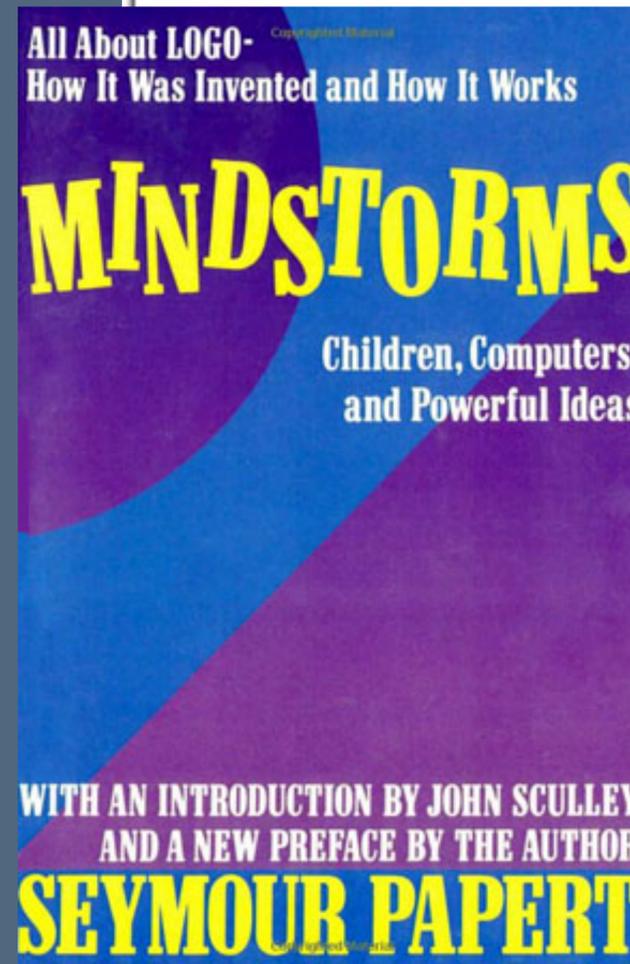

Logo: programming for children

[Papert 1980]

Constructionist learning:

learning happens most effectively when people are making tangible objects

Lego Mindstorms followed this mold and was named after it

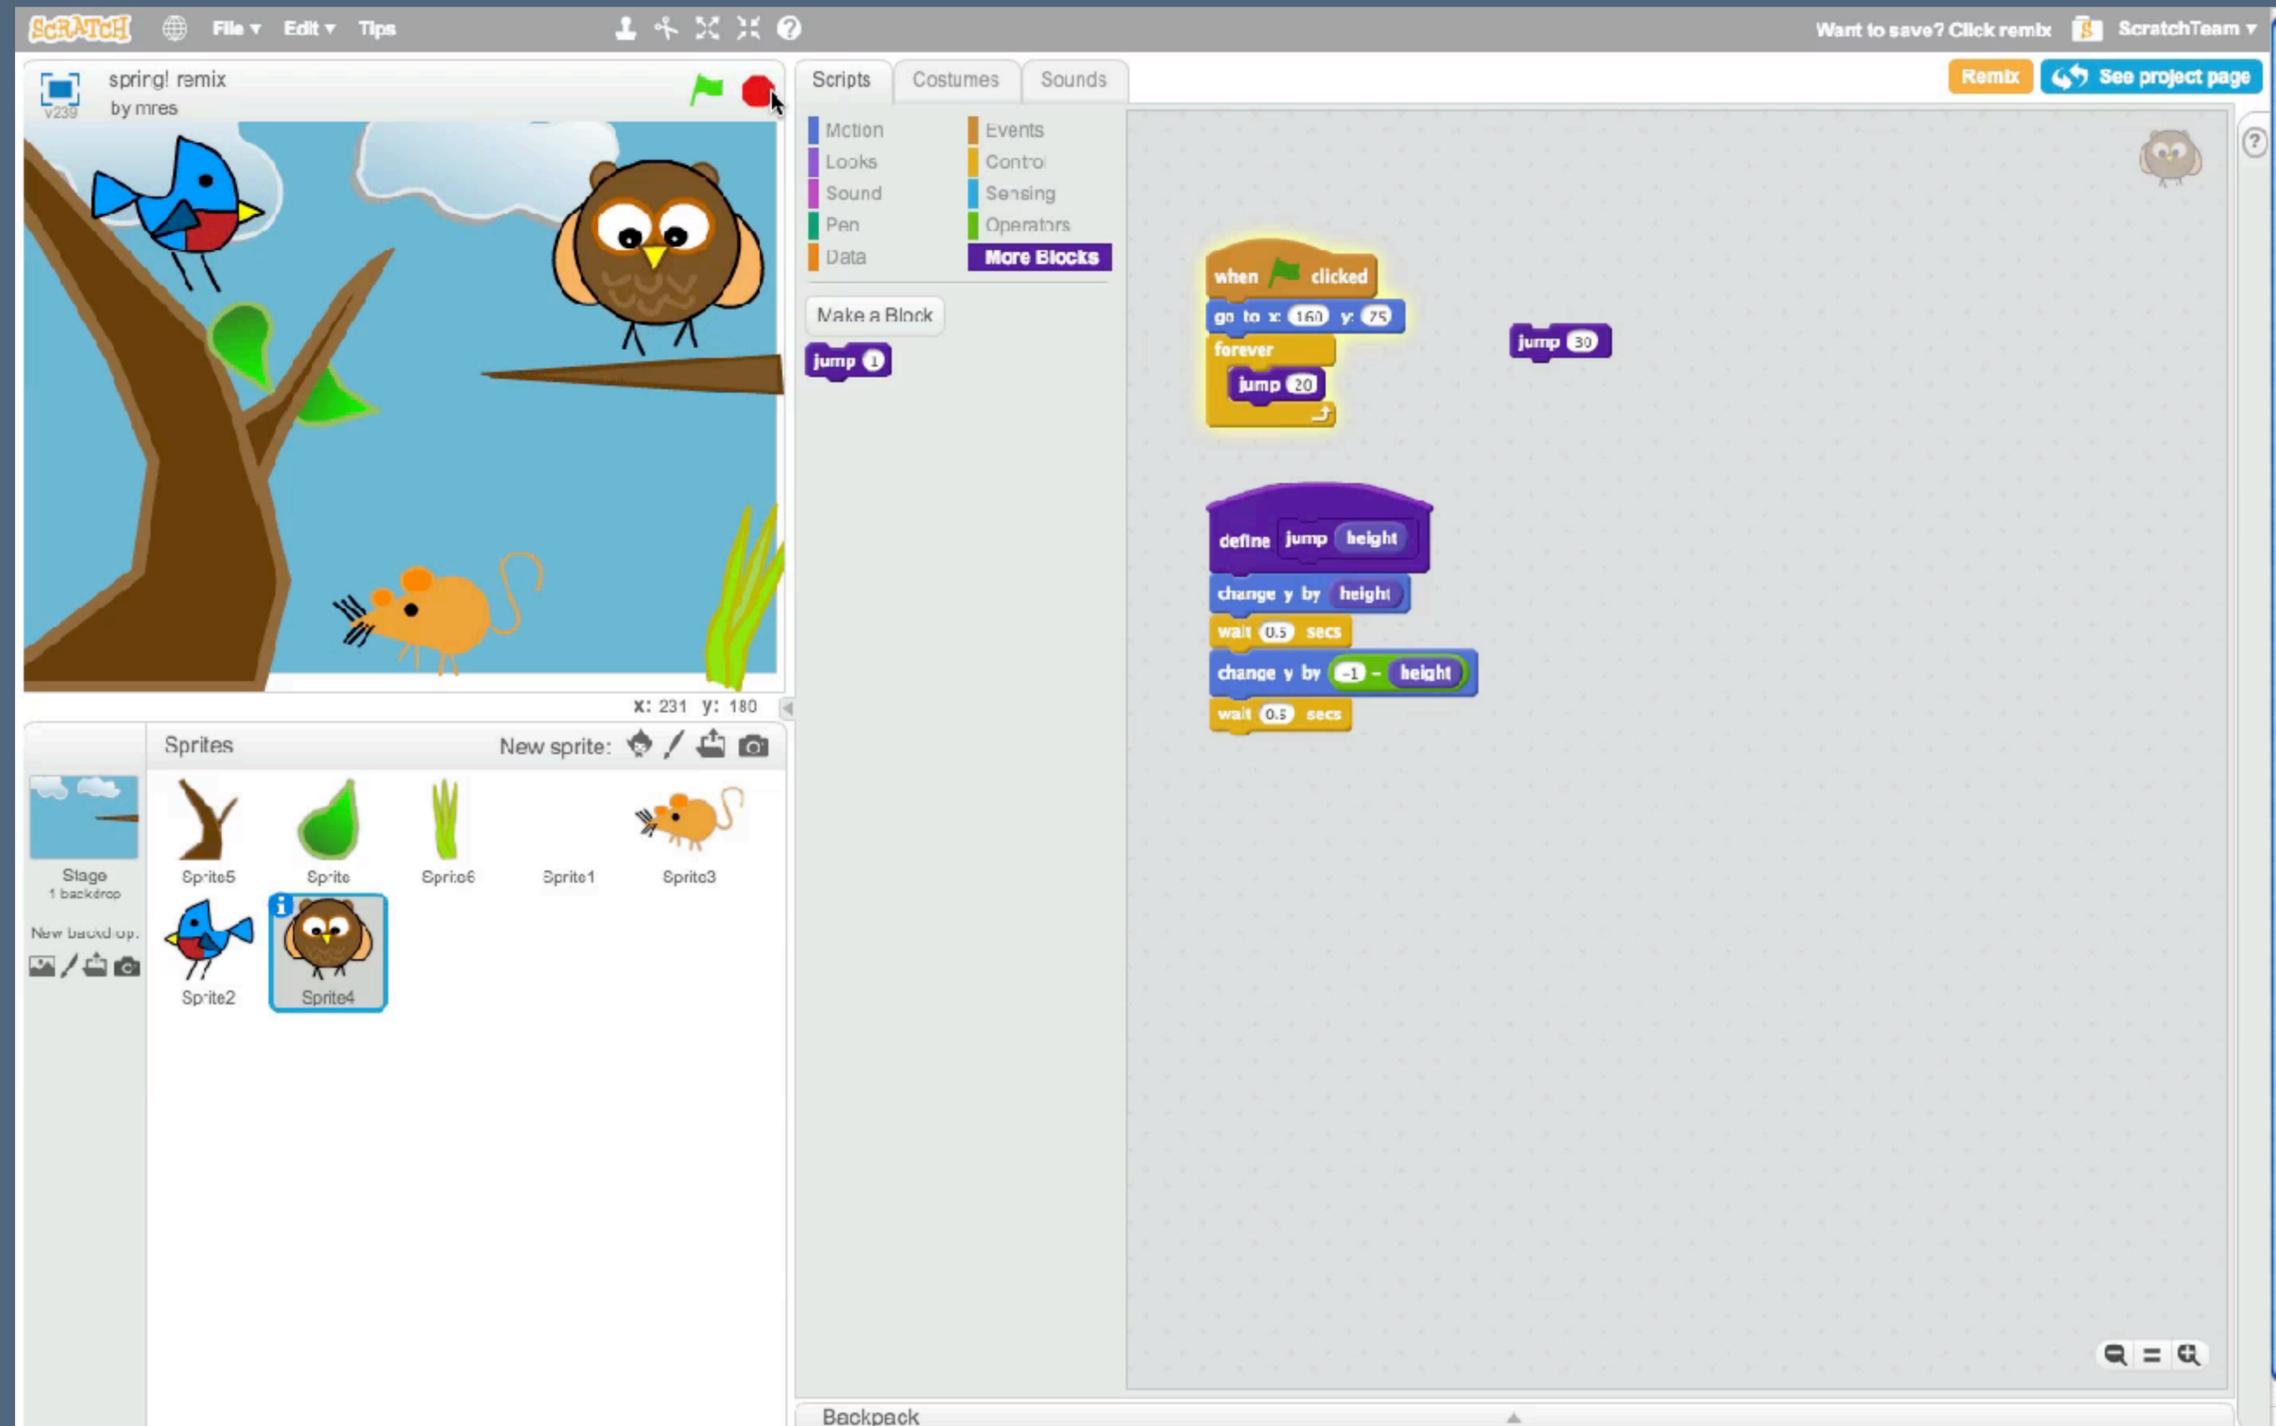

Scratch

[Resnick et al. 2009]

Inherited from Logo:

Block-based programming of simple animations and games as a gateway to programming for children

Online python tutor

[Guo 2013]

Embeddable Python data structure visualization

Over 200,000 users and a dozen universities using it

The image shows a screenshot of the Online Python Tutor interface. On the left, a code editor displays the following Python code:

```
1 def listSum(numbers):  
2     if not numbers:  
3         return 0  
4     else:  
5         (f, rest) = numbers  
6         return f + listSum(rest)  
7  
8 myList = (1, (2, (3, None)))  
9 total = listSum(myList)
```

Line 2 is highlighted with a green arrow, indicating it has just executed. Line 5 is highlighted with a red arrow, indicating it is the next line to execute. Below the code editor is a progress bar and navigation buttons: "< Back", "Step 11 of 18", and "Forward >".

On the right, a memory visualization diagram shows the state of the program. It is divided into two sections: "Frames" and "Objects".

Global variables: A dictionary containing 'listSum' (pointing to the function object) and 'myList' (pointing to the first tuple object).

listSum frame (top): Contains variables 'numbers' (pointing to the first tuple), 'f' (value 1), and 'rest' (pointing to the second tuple).

listSum frame (bottom): Contains variables 'numbers' (pointing to the second tuple), 'f' (value 2), and 'rest' (pointing to the third tuple).

Objects: Three tuple objects are shown, each with two slots:

- Tuple 1: [0, 1] (pointed to by 'myList' and the 'numbers' variable in the top listSum frame)
- Tuple 2: [0, 1] (pointed to by the 'rest' variable in the top listSum frame and the 'numbers' variable in the bottom listSum frame)
- Tuple 3: [0, 1] (pointed to by the 'rest' variable in the bottom listSum frame)

The second and third tuple objects have their second slots containing the value 'None'.

Summary

Programming tools often either aim to **reduce the threshold** or **increase the ceiling** — how depends on which one we're pursuing

Successful programming tools **shift our cognitive problem representations** to make the task more readily solvable

Tools for **learning programming** help externalize our cognition to better understand what code is doing (or ought to be doing)
